The developers of high-performance scientific applications often work in complex computing environments that place heavy demands on program analysis tools. The developers need tools that interoperate, are portable across machine architectures, and provide source-level feedback. In this paper, we describe a tool framework, the Program Database Toolkit (PDT), that supports the development of program analysis tools meeting these requirements. PDT uses compile-time information to create a comp ...

4	Toward a logical/physical theory of spreadsheet modeling	_
•	Tamés Indianita Chiman Cabadaa Hanni C. Lucas	-
	Publisher: ACM Press	
	Full text available: pdf(2.76 MB)  Additional Information: full citation, abstract, references, citings, index terms, review	
	In spite of the increasing sophistication and power of commercial spreadsheet packages, we still lack a formal theory or a methodology to support the construction and maintenance of spreadsheet models. Using a dual logical/physical perspective, we identify four principal components that characterize any spread sheet model: schema, data, editorial, and binding. We present a factoring algorithm for identifying and extracting these components

	Understanding distributed applications is a tedious and difficult task. Visualizations based on process-time diagrams are often used to obtain a better understanding of the execution of the application. The visualization tool we use is Poet, an event tracer developed at the University of Waterloo. However, these diagrams are often very complex and do not provide the user with the desired overview of the application. In our experience, such tools display repeated occurrences of non-trivial commun

	Synthetic English is a very-high-level query language based on natural English. Query specification in Synthetic English parallels the user's natural thought processes, thereby allowing him to formulate complex queries without regard to implicit or explicit language control structures. Synthetic English is designed to be used in conjunction with the Functional Data Model, which is a conceptual graph model whose nodes and arcs represent sets and total functions, respectively. Further, the Fu

#### review

An algorithm component is an implementation of an algorithm which is not intended to be a stand-alone module, but to perform a specific task within a large software package or even within several distinct software packages. Therefore, the design of algorithm components must also incorporate software-engineering aspects. A key design goal is adaptability. This goal is important for maintenance throughout a project, prototypical development, and reuse in new, unforseen contex ...

In this paper we present a method of code implementation that works in conjunction with collaboration and responsibility based analysis modeling techniques to achieve better code reuse and resilience to change. Our approach maintains a closer mapping from responsibilities in the analysis model to entities in the implementation. In so doing, it leverages the features of flexible design and design reuse found in collaboration-based design models to provide similar adaptability and reuse in the imp ...

<sup>9</sup> A truly generative semantics-directed compiler generator

This paper describes semantic processing in the compiler generating system MUG2. MUG2 accepts high-level descriptions of the semantics of a programming language including full runtime semantics, data flow analysis, and optimizing transformations. This distinguishes MUG2 from systems such as YACC [Joh75], HLP [HLP78], PQCC [PQC79], or its own former version [GRW77] with respect to expressive power and convenience. In this respect, MUG2 comes close to semantics-directed systems such as [Mos76 ...

This paper describes a methodology for the development of WWW applications and a tool environment specifically tailored for the methodology. The methodology and the development environment are based upon models and techniques already used in the hypermedia, information systems, and software engineering fields, adapted and blended in an original mix. The foundation of the proposal is the conceptual design of WWW applications, using HDM-lite, a notation for the specification of structure, nav ...

The eXtensible Markup Language (XML) is fast emerging as the dominant standard for describing and interchanging data among various systems and databases on the Internet. It offers the Document Type Definition (DTD) as a formalism for defining the syntax and structure of XML documents. The XML Schema definition language, as a replacement for the DTD, provides more rich facilities for defining and constraining the content of XML documents. However, it does not concentrate on the semantics that und ...

13 XML: Schemapath, a minimal extension to xml schema for conditional constraints

Claudio Sacerdoti Coen, Paolo Marinelli, Fabio Vitali

May 2004 Proceedings of the 13th international conference on World Wide Web Publisher: ACM Press

Full text available: pdf(198.40 KB) Additional Information: full citation, abstract, references, index terms

In the past few years, a number of constraint languages for XML documents has been proposed. They are cumulatively called schema languages or validation languages and they comprise, among others, DTD, XML Schema, RELAX NG, Schematron, DSD, xlinkit. One major point of discrimination among schema languages is the support of coconstraints, or co-occurrence constraints, e.g., requiring that attribute A is present if and only if attribute B is (or is not) presentin the same element. Although ...

Information structure models: Data structure models for programming languages

February 1971 ACM SIGPLAN Notices, Volume 6 Issue 2

Publisher: ACM Press

Full text available: pdf(6.62 MB) Additional Information: full citation, abstract, references

This paper introduces a class of models (information structure models) for characterizing

computations in terms of the data structures to which they give rise during execution, shows how such models can be used to characterize automata, digital computers and programming languages, considers in some detail the data structures generated during the execution of programs in block structure languages, develops a model for a non-block structure language (SNOBOL 4) and indicates how information structu ...

15 Transformations and Experiences: VXT: a visual approach to XML transformations

Emmanuel Pietriga, Jean-Yves Vion-Dury, Vincent Quint

November 2001 Proceedings of the 2001 ACM Symposium on Document engineering

Publisher: ACM Press

Full text available: pdf(165.99 KB)

Additional Information: full citation, abstract, references, citings, index terms

The domain of XML transformations is becoming more and more important as a result of the increasing number of applications adopting XML as their format for data exchange or representation. Most of the existing solutions for expressing XML transformations are textual languages, such as XSLT or DOM combined with a general-purpose programming language. Several tools build on top of these languages, providing a graphical environment. Transformations are however still specified in a textual way using ...

Full text available: pdf(587.36 KB)

Additional Information: full citation, abstract, references, citings, index

 $\cdot$  In this paper we present the data manipulation facility for a structured English query  $\cdot$ language (SEQUEL) which can be used for accessing data in an integrated relational data base. Without resorting to the concepts of bound variables and quantifiers SEQUEL identifies a set of simple operations on tabular structures, which can be shown to be of equivalent power to the first order predicate calculus. A SEQUEL user is presented with a consistent set of keyword English templates which reflect h ...

17 An algorithm for efficiently generating summary paragraphs using tree-adjoining grammar

Bruce Eddy, Diana Bental, Alison Cawsey

July 2001 Proceedings of the 8th European workshop on Natural Language Generation - Volume 8 EWNLG '01

Publisher: Association for Computational Linguistics

Full text available: pdf(93.52 KB) Additional Information: full citation, abstract, references

We present an algorithm which improves the efficiency of a search for the optimally aggregated paragraph which summarises a flat structured input specification. We model the space of possible paraphrases of possible paragraphs as the space of sequences of compositions of a set of tree-adjoining grammar (TAG) elementary trees. Our algorithm transforms this to a set with equivalent paraphrasing power but better computational properties. Also, it identifies an explicit mapping between input proposi ...
